

opencart vs bagisto

OpenCart is a mature, widely-used platform great for smaller stores, while Bagisto, built on Laravel, offers modern features, strong multi-channel/multi-vendor support, and better product type flexibility (subscriptions, bookings), making it ideal for more complex, scalable e-commerce like B2B or marketplaces, though OpenCart might have broader community support but Bagisto provides cleaner, faster product creation and modern architecture.

OpenCart:

Pros: Long-standing, good for basic stores, large community, free core.

Cons: Can feel dated, less intuitive for complex needs, potentially steeper learning curve for advanced features.

Bagisto:

Pros: Built on Laravel (modern PHP framework), excellent for multi-vendor/channel, supports subscriptions/bookings, easier product creation, headless/multi-tenant ready, pure RTL support.

Cons: Newer, so community/extensions might be less vast than OpenCart's; needs more guidance on package/module development.

When to Choose Which:

Choose OpenCart if: You're starting a simple, small-to-medium-sized store and need something straightforward and widely supported.

Choose Bagisto if: You're building a complex marketplace, need multi-channel inventory, want modern features (subscriptions, headless), or prefer a Laravel-based, scalable platform.
