

# MULTIVERISIONS ON UBUNTU BOX

```
sudo apt install apache2 libapache2-mod-fastcgi
```

```
sudo apt-get install mysql-server  
sudo mysql_secure_installation
```

```
sudo apt install software-properties-common  
sudo add-apt-repository ppa:ondrej/php  
sudo apt update
```

Use this command to install different versions of php just changing the string 7.1 to the required version

```
sudo apt install php7.1 php7.1-fpm libapache2-mod-php7.1
```

NOW ALL SET LAMP is installed and working

Now while u will require to change the php version

This command will change the php version on system

```
sudo update-alternatives --config php
```

Disable all version apached modules of php installed, just replace the 7.4 in below command

```
sudo a2dismod php7.4
```

Enable the version u need to use with apache, just replace the 8.0 in below command

```
sudo a2enmod php8.0
```

Restart the apache

```
sudo service apache2 restart
```
