

jquery.colorbox.js

`jquery.colorbox.js` refers to the ColorBox jQuery plugin, a lightweight and customizable lightbox solution. It is designed to display various types of content, including images, image groups (slideshows), AJAX content, inline HTML, and iframed content, in a modal window or overlay on a webpage.

Key features and usage:

- **Lightbox functionality:** ColorBox provides the classic lightbox effect, dimming the background and displaying content in a central, interactive overlay.
- **Content types:** It supports a wide range of content, making it versatile for different web development needs.
- **Customization:** The plugin offers numerous options for customization through an object of key/value pairs passed during initialization. This allows control over appearance, behavior, and responsiveness.
- **Integration with jQuery:** As a jQuery plugin, it extends the functionality of the jQuery library, requiring jQuery to be included in the HTML document before `jquery.colorbox.js`.
- **Implementation:** To use ColorBox, you typically include the `jquery.min.js` (or similar jQuery core file) and `jquery.colorbox-min.js` (or `jquery.colorbox.js`) files in the `<head>` section of your HTML, along with the associated `colorbox.css` stylesheet for styling.
- **Basic usage example:**

JavaScript

```
$(document).ready(function(){
    $(".example-link").colorbox({
        rel: 'gallery', // groups items for a slideshow
        transition: 'fade', // animation type
        width: '80%', // width of the lightbox
        height: '80%' // height of the lightbox
    });
});
```
