

to increase memory power in wordpress

To increase the memory limit in WordPress, you can edit the wp-config.php file by adding

`define('WP_MEMORY_LIMIT', '256M');` above the "That's all, stop editing!" line, or add `php_value memory_limit 256M` to your `.htaccess` file. You can also increase the limit through your hosting control panel or by contacting your hosting provider, who may have other methods available.

Using `wp-config.php`

Access your WordPress files via FTP or your hosting file manager.

Locate and open the `wp-config.php` file in the root directory.

Find the line that reads `/* That's all, stop editing! Happy publishing. */`.

Right before this line, add the following code: `define('WP_MEMORY_LIMIT', '256M');`.

Save the file.

Using `.htaccess`

Access your WordPress files and locate the `.htaccess` file in the root directory (you may need to enable "Show Hidden Files" in your file manager).

Make a backup of the file before editing.

Add the following line to the file: `php_value memory_limit 256M`.

Save the file and upload it back to your server.

Other methods

Hosting control panel: Log in to your hosting account and find the PHP settings (e.g., MultiPHP INI Editor in cPanel or PHP Configuration in hPanel). Change the `memory_limit` there and save your changes.

Contact your hosting provider: If the above methods don't work, your host may have specific instructions or can change the setting for you.

Upgrade your hosting plan: In some cases, your current hosting plan may have a hard limit on memory, and an upgrade might be necessary to increase it further.
